

LIDAR Systems

A Major Step To

Efficient Surveying Methods

Ralf Schroth

Overview

- **Introduction FIG**
- **Sensors in Surveying**
- **LIDAR – The Success Story**
- **Summary**

Introduction - FIG

International Federation of Surveyors
Fédération Internationale des Géomètres
Internationale Vereinigung der Vermessungsingenieure

- founded 1878 in Paris
- Federation of national associations
- the only international body that represents all surveying disciplines
- UN recognized NGO

Fédération Internationale des Géomètres

MENSI 3rd DiMENSIon

Hansa Luftbild
German Air Surveys

Introduction - FIG

International Federation of Surveyors
Fédération Internationale des Géomètres
Internationale Vereinigung der Vermessungsingenieure

More than 100 countries are represented

Members:

**member associations
affiliates
corporate members
academic members**

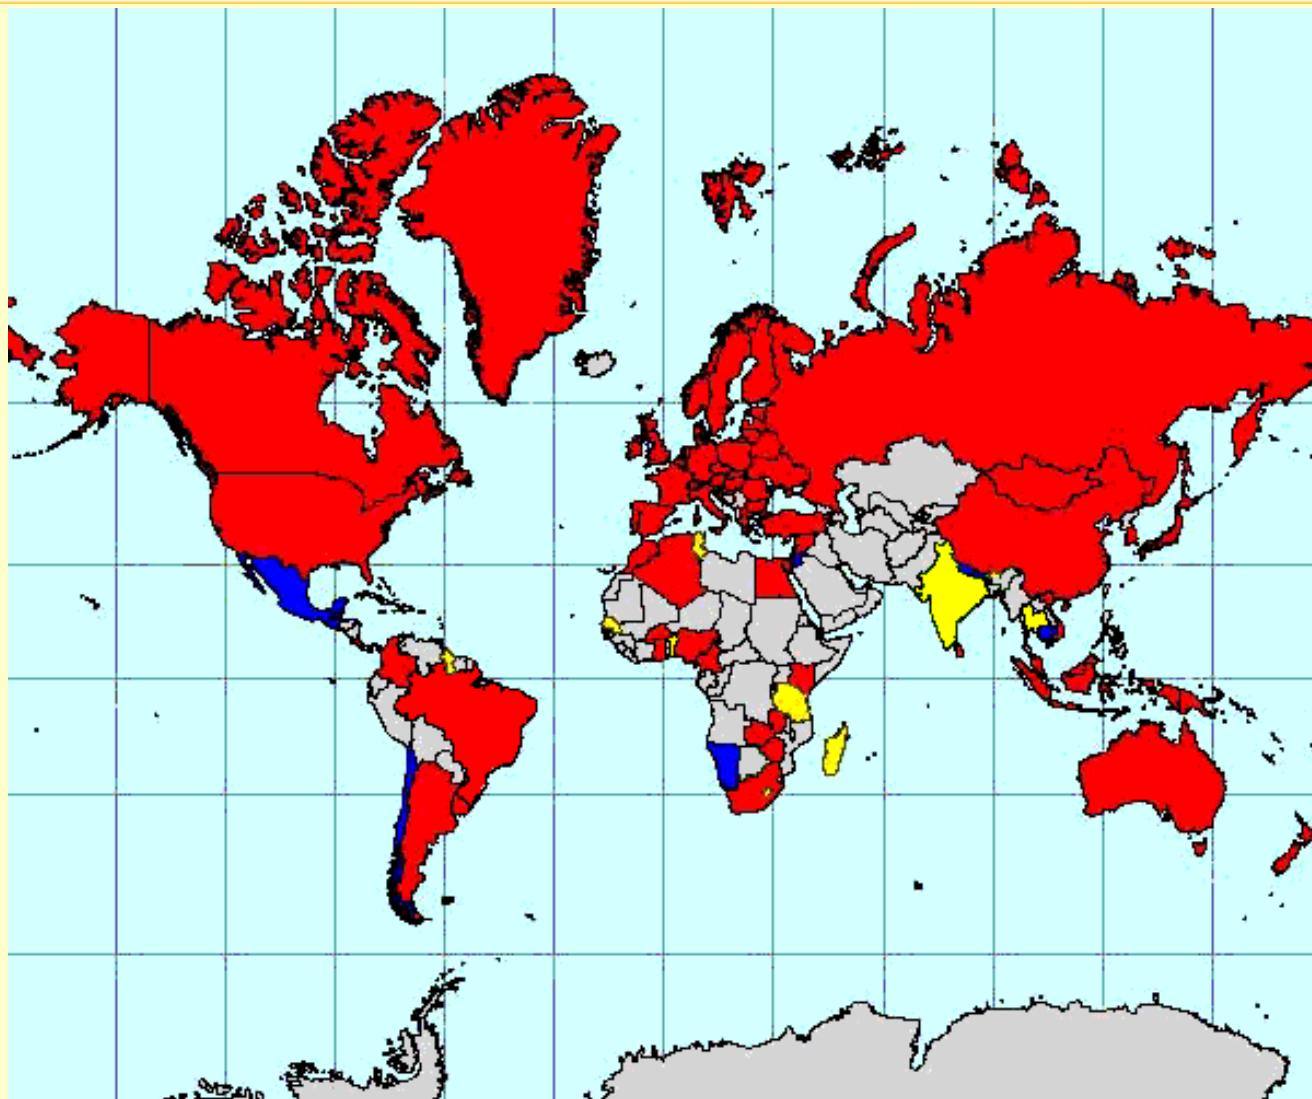

Fédération Internationale des Géomètres

MENSI 3rd DiMENSIon

Hansa Luftbild
German Air Surveys

Introduction - FIG

International Federation of Surveyors
Fédération Internationale des Géomètres
International Vereinigung der Vermessungsingenieure

FIG Office in Copenhagen

November 2002

Fédération Internationale des Géomètres

MENSI 3rd DiMENSIon

Hansa Luftbild
German Air Surveys

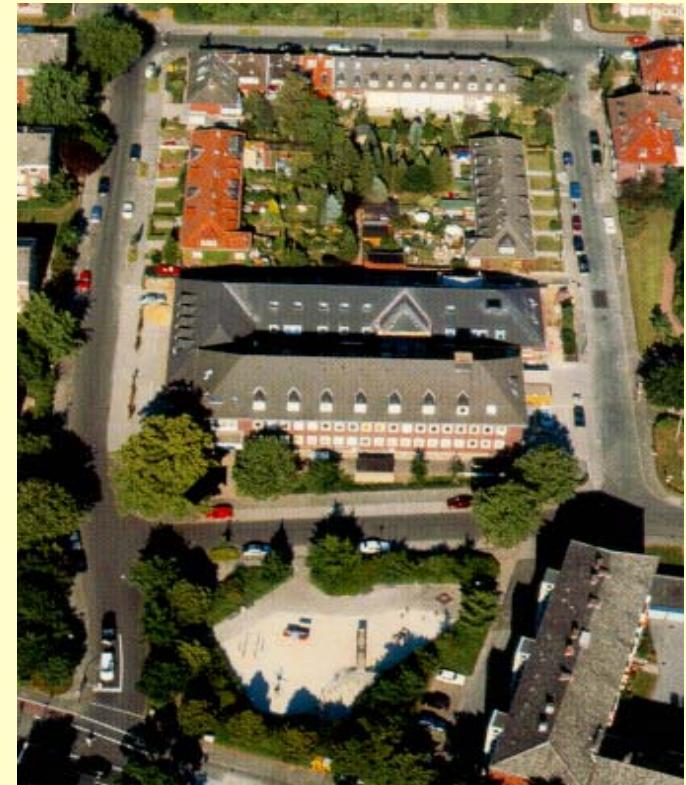

Introduction – Hansa Luftbild

► Employees

- 120 employees in Germany
(50% with academic degrees)
- over 200 employees in total
- proofed excellence in Land Management Process know-how all over the world

► Company

- Existing since 80 years
- Projects in 70% of all countries world-wide
- a world-wide reputation as an excellent solution provider

Head Quarters in Münster

Hansa Luftbild Branches

Sensors in Surveying

Contactless Measurements

I. Airborne

Photogrammetry

Radar

LIDAR

II. Terrestrial

Close Range Photogrammetry

LIDAR

Sensors in Surveying

Radar

active sensor system

broad radio waves

3D by interferometry

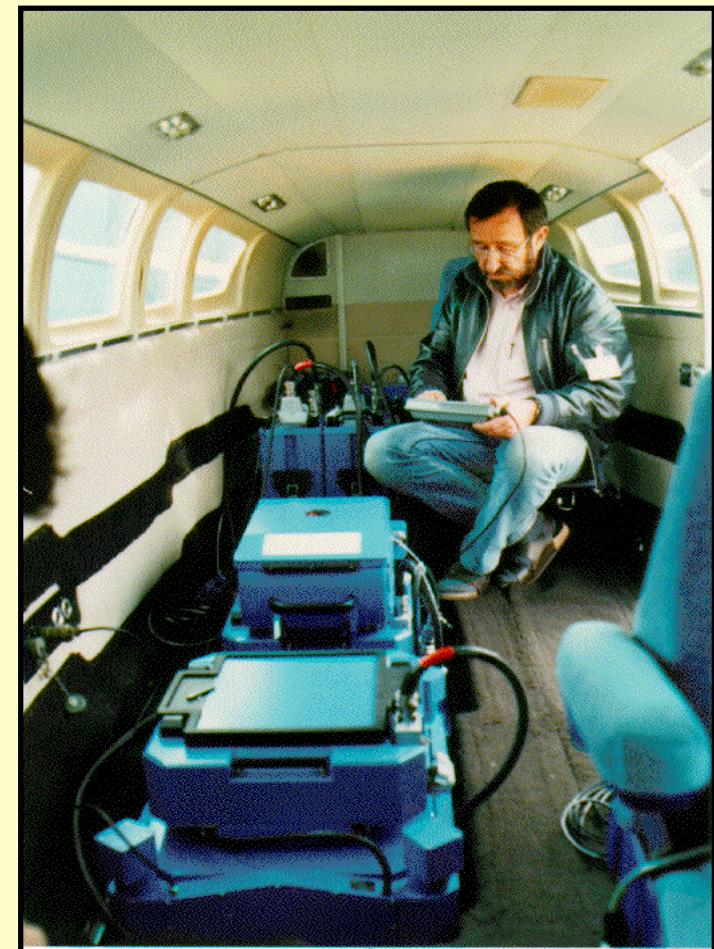

Sensors in Surveying

Photogrammetry

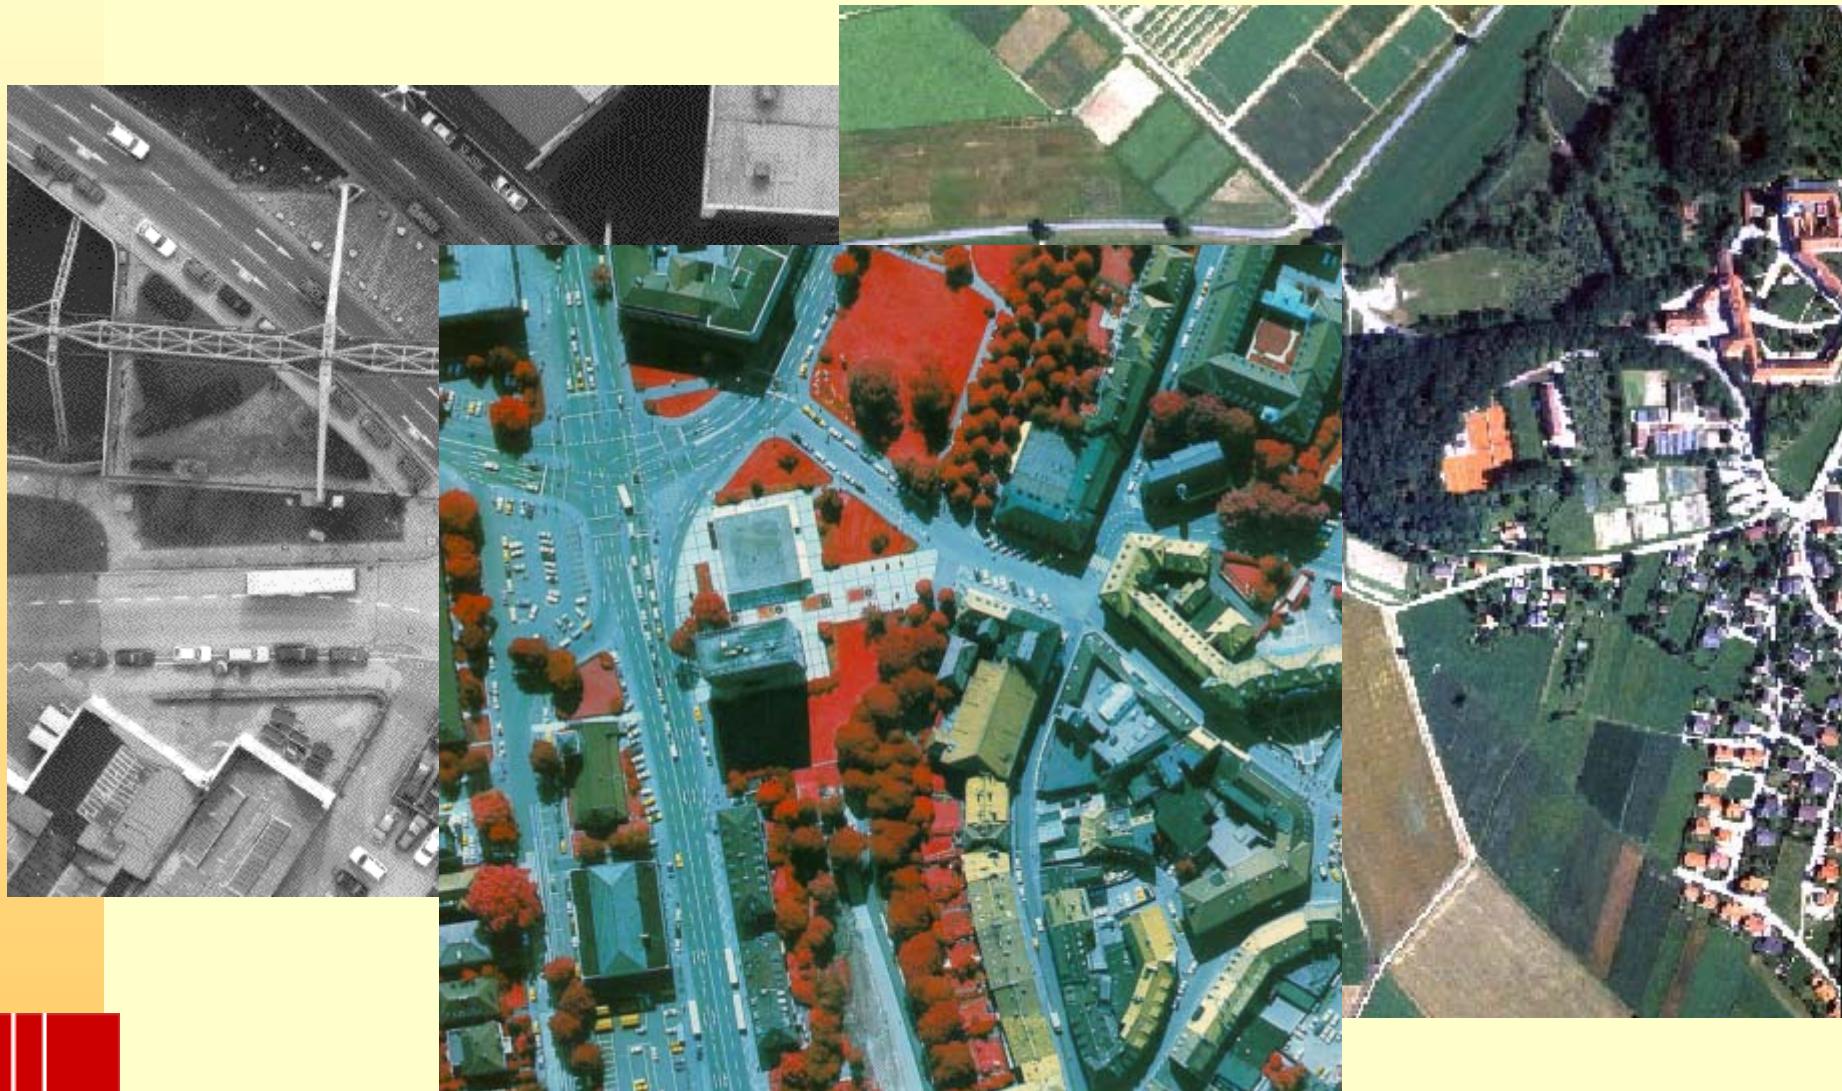

film cameras

digital cameras

GPS/INS

Sensors in Surveying

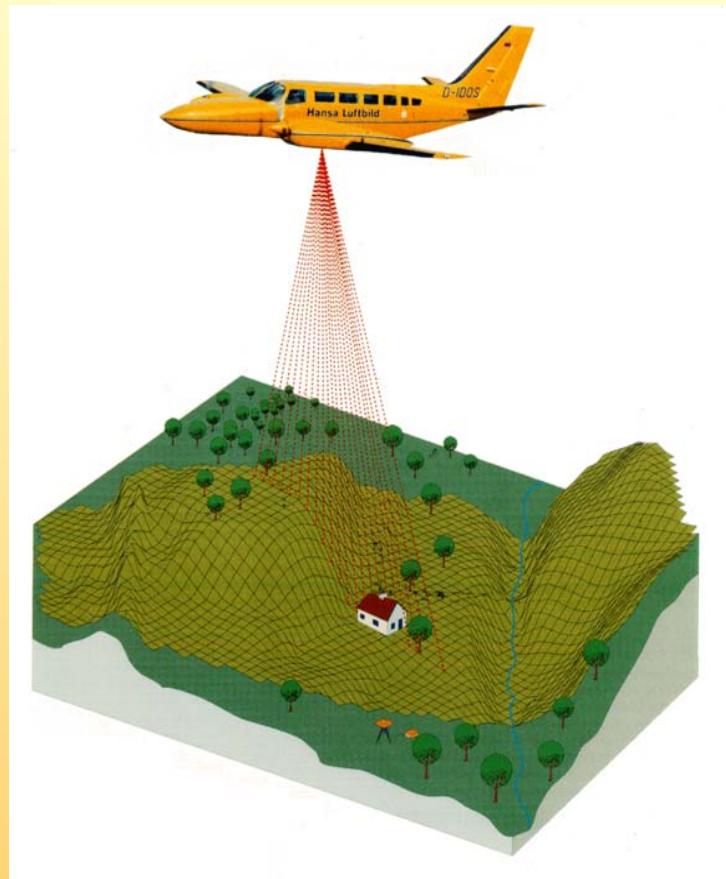

Sensors in Surveying

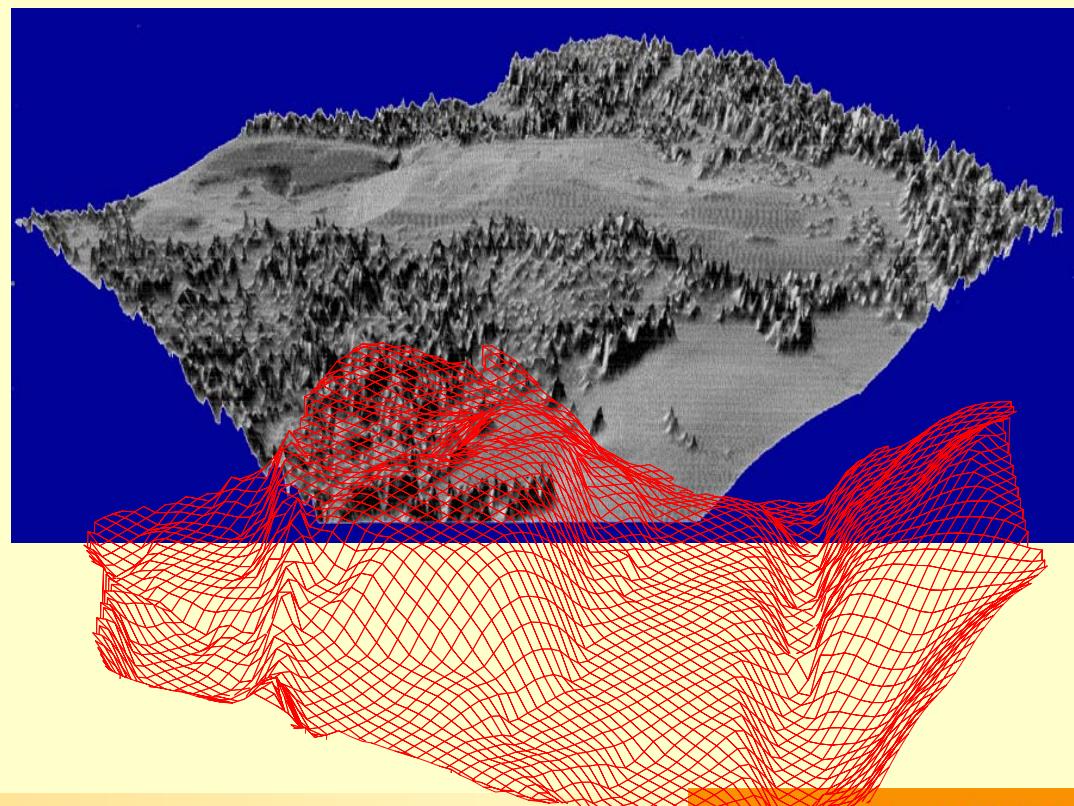

LIDAR Systems

Sensors in Surveying

Airborne Laser Scanning

LIDAR – The Success Story

Beginning : Laser Distance Measurement

1970 Laser Profilers

1990 Laser Scanning Devices

Challenge: sensor orientation

Sensor Orientation

Exterior orientation solved by GPS/INS

**Example of a
complete system:**

**GPS
IMU
flight navigation**

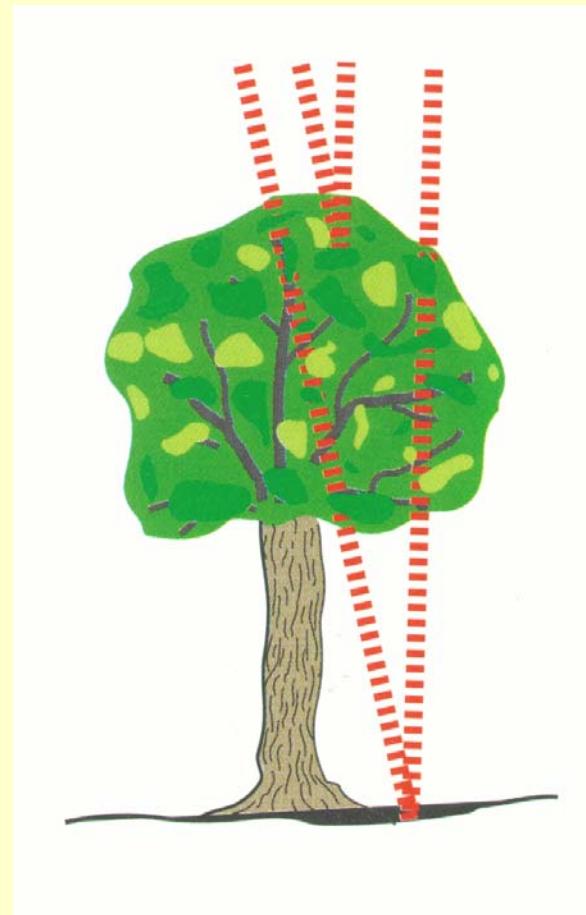

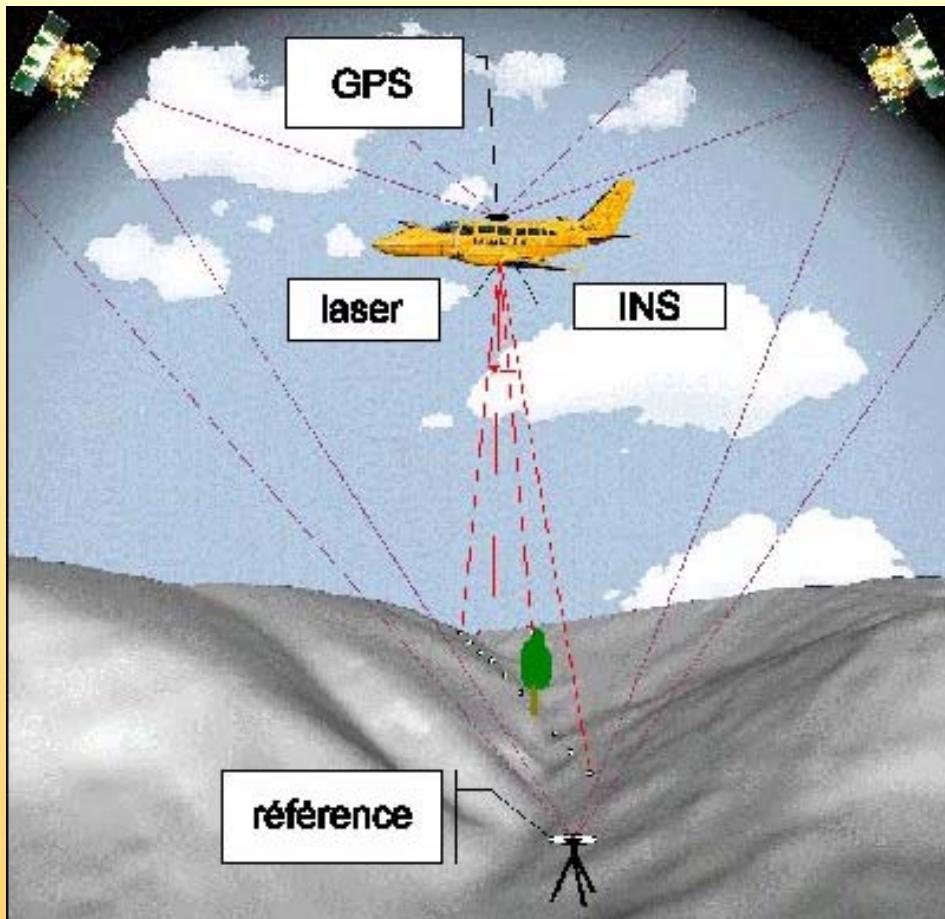

Airborne LIDAR

Since 1992

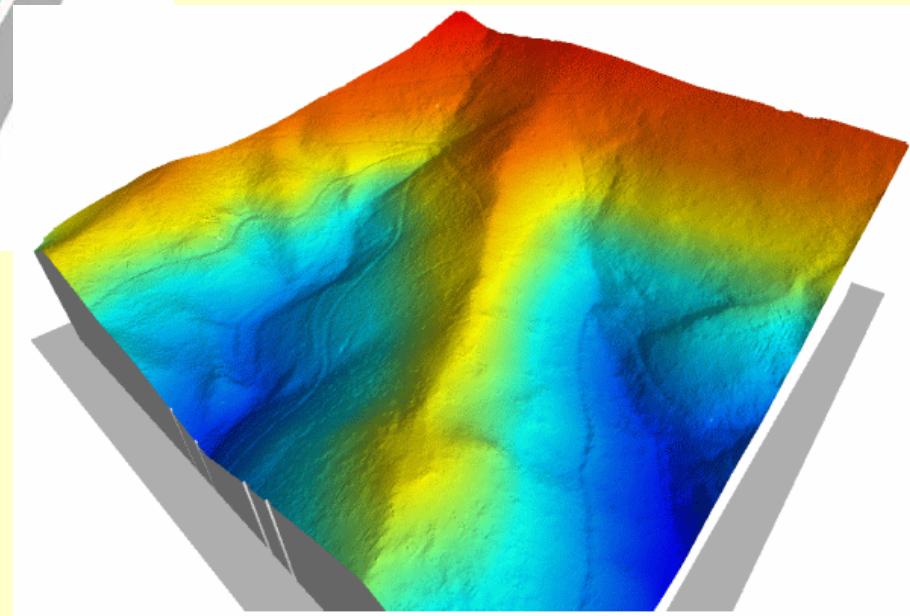

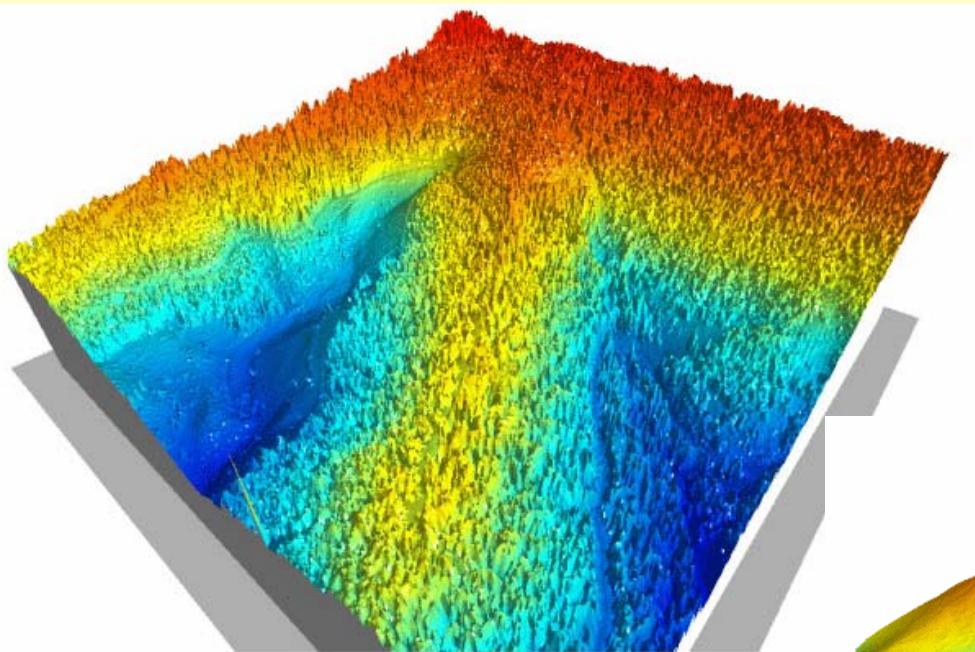

type	sampl. rate	angle	range
ALTM 2050	50 kHz	+/-20°	210 - 2000 m
ALTM 1225	25 kHz	+/-20°	300 - 2000 m
ALTM 1020	5 kHz	+/-20°	330 – 1000 m

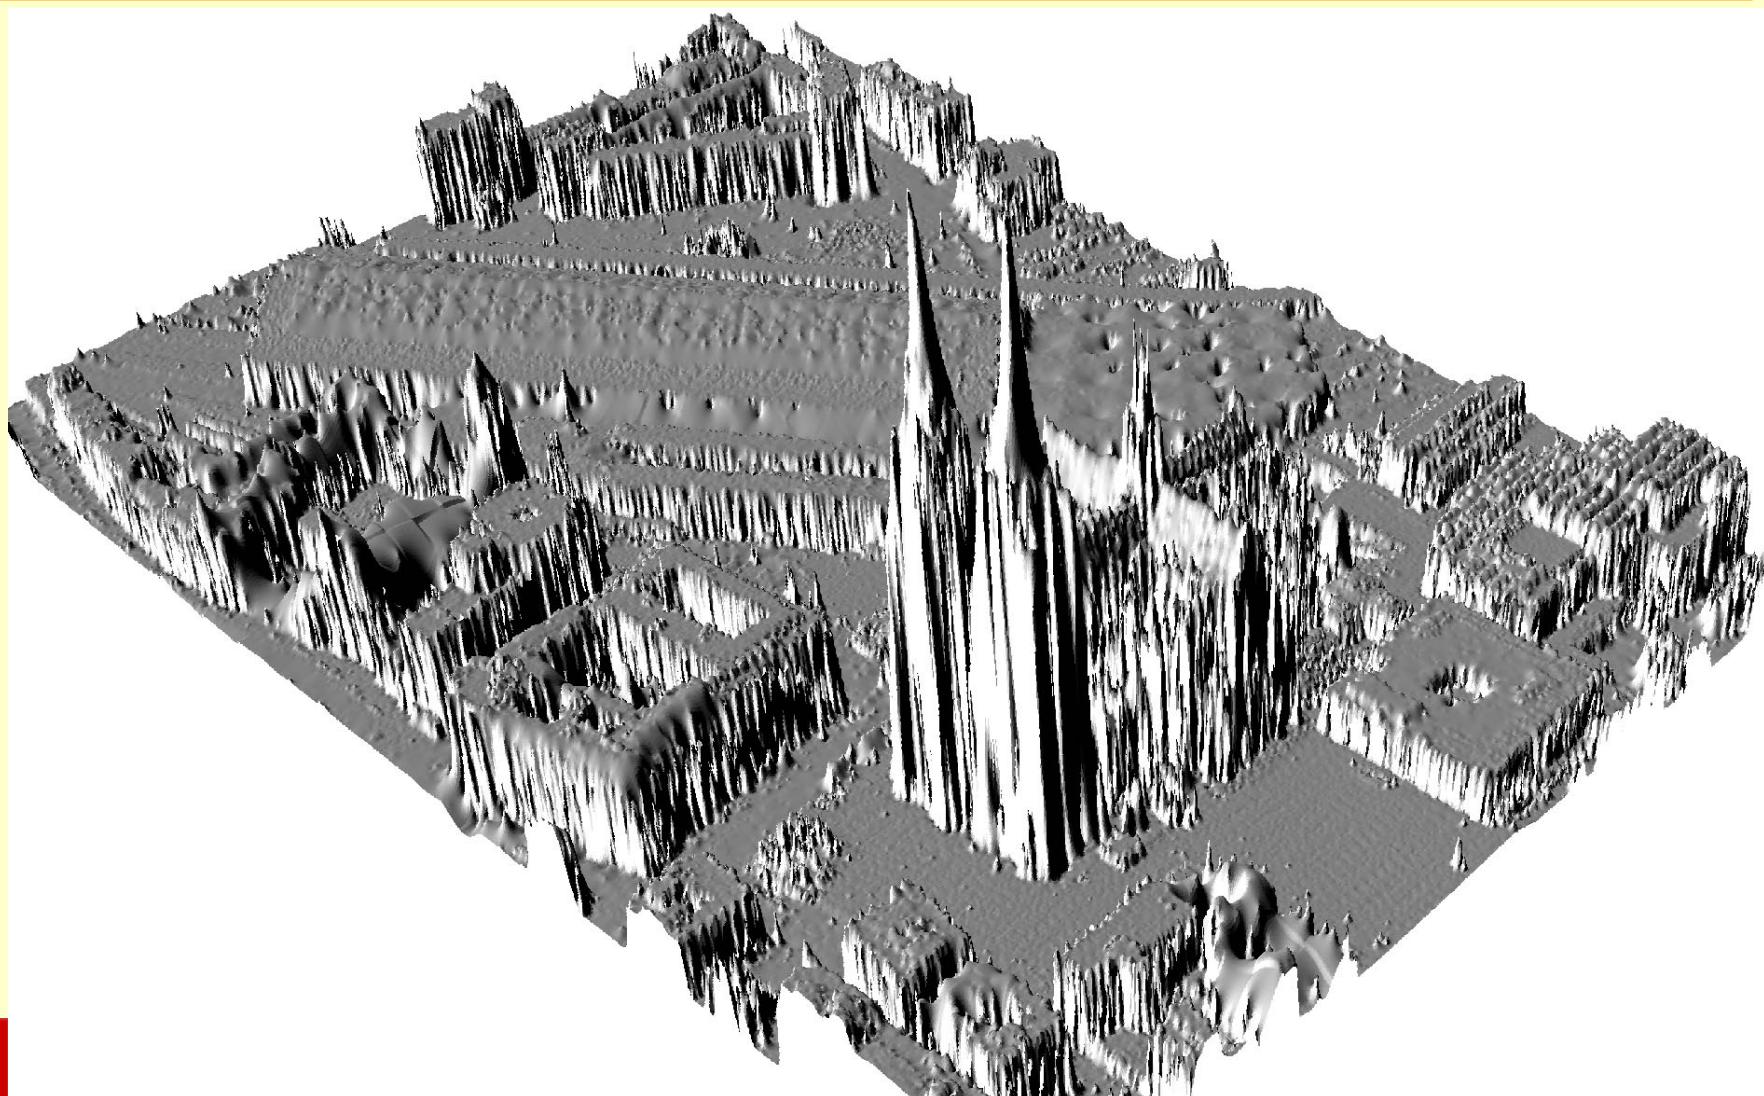

Airborne LIDAR

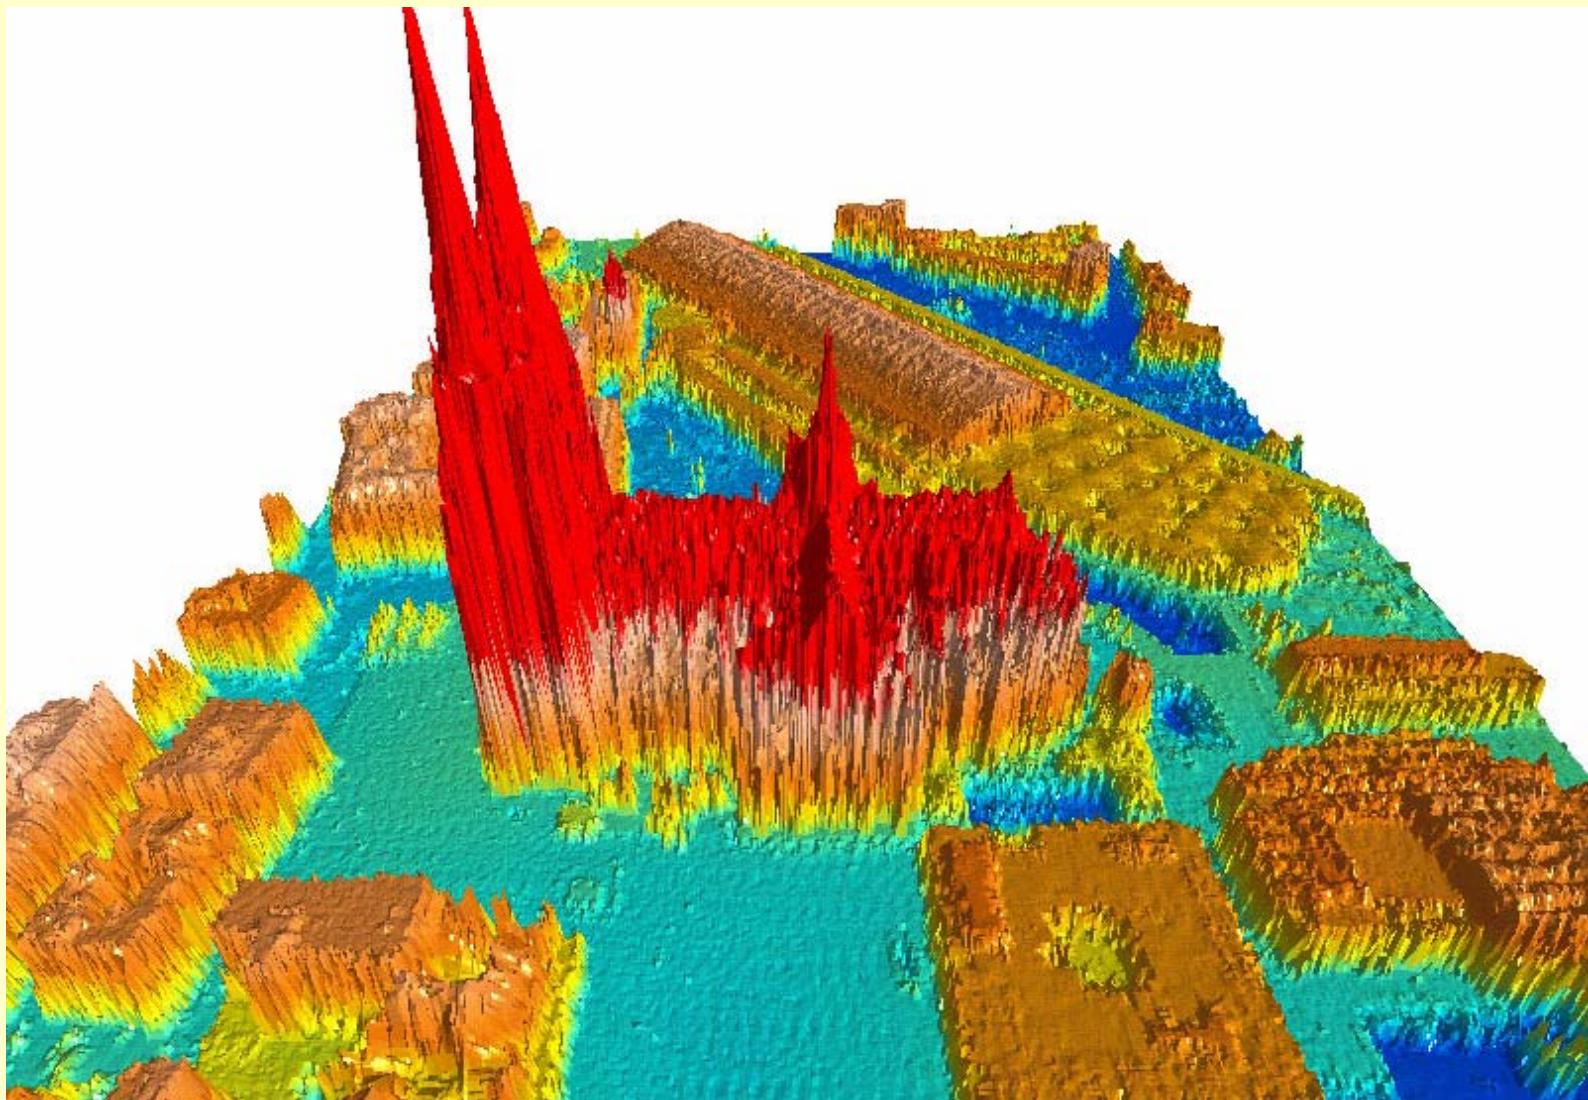

Airborne LIDAR

Airborne LIDAR - DSM

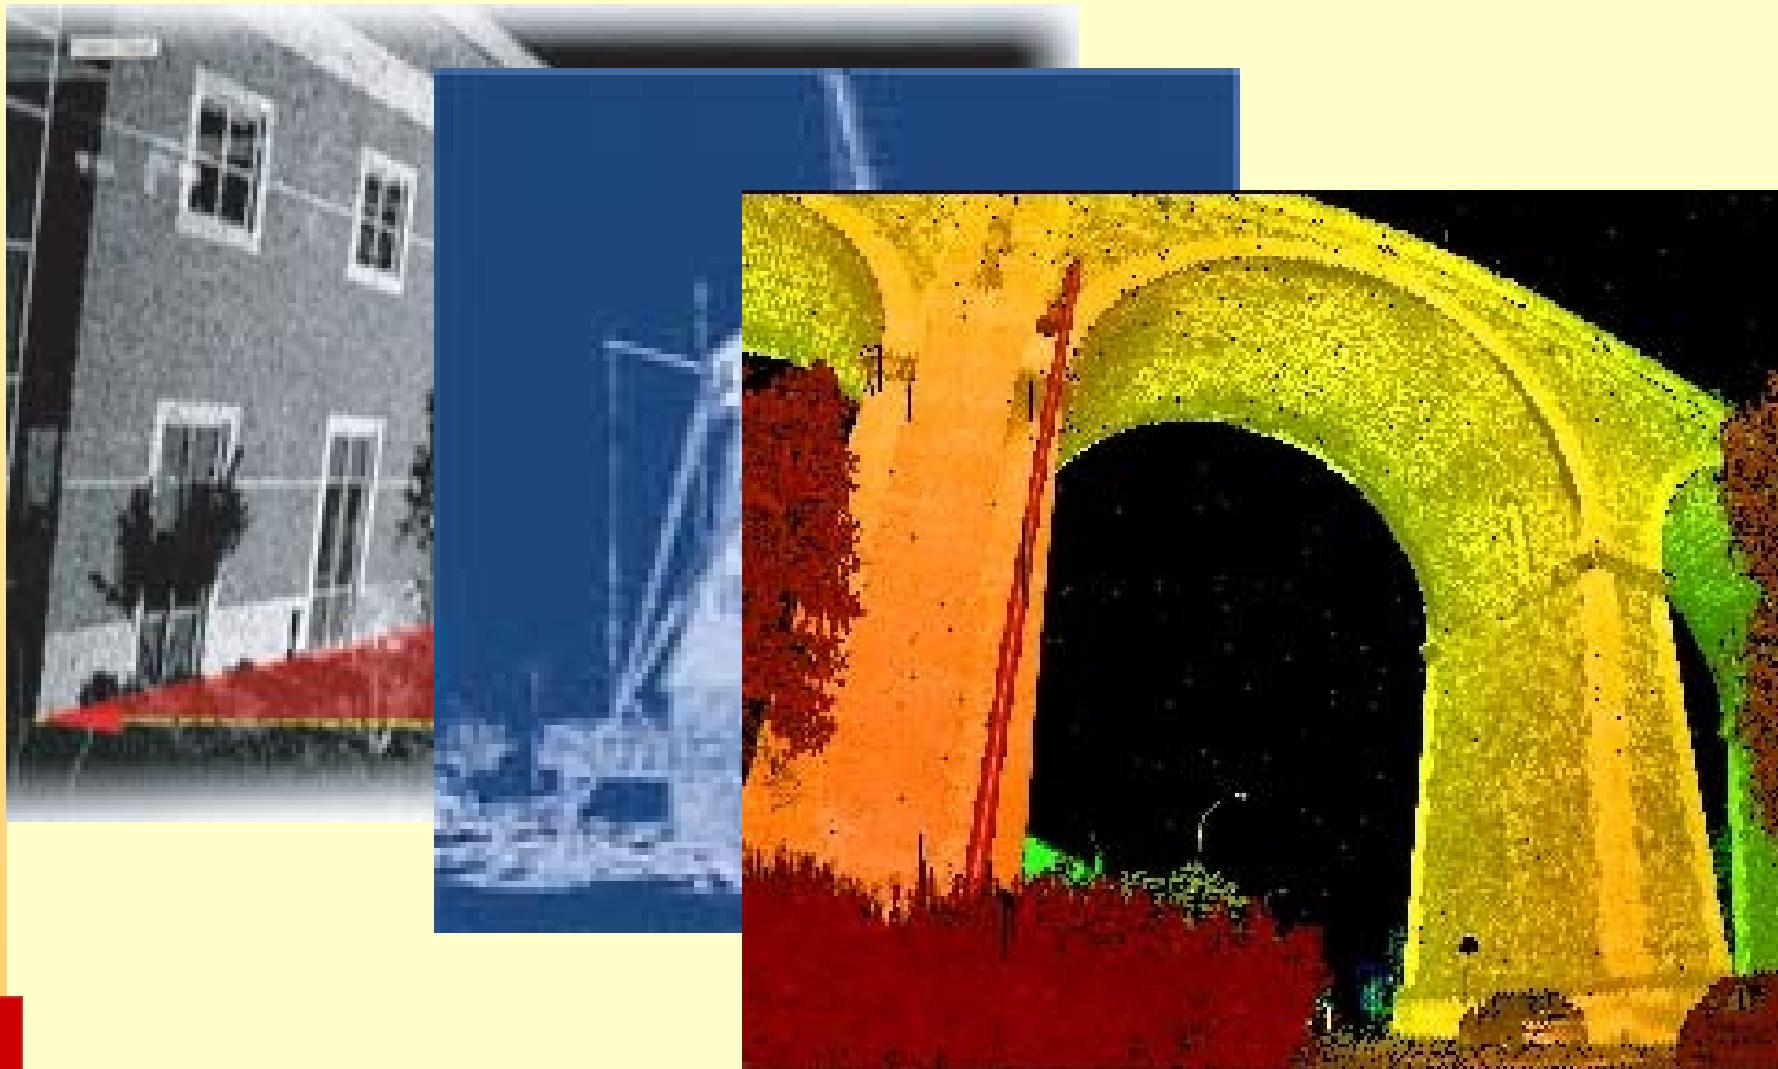

Terrestrial LIDAR

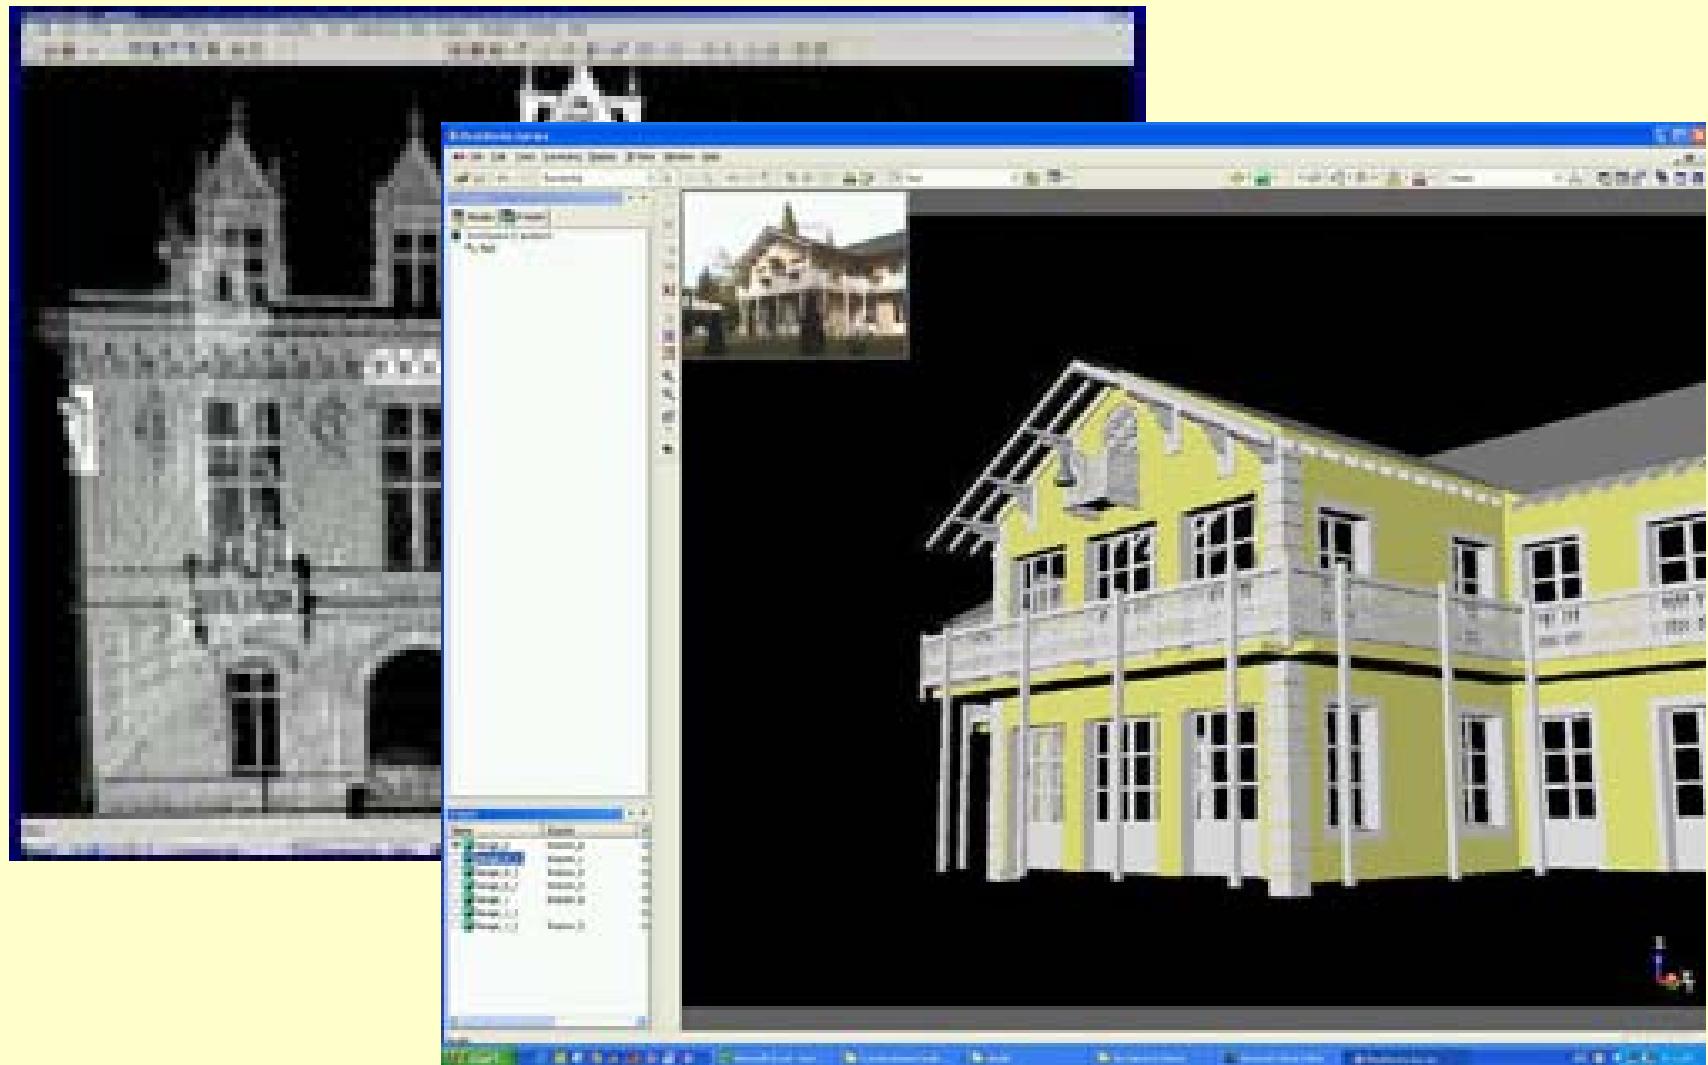

Mid
and
close range applications

Terrestrial LIDAR

Terrestrial LIDAR

LIDAR

General Results of LIDAR

3D point cloud

besides intensity no attributes

Major Step

Generation of objects out of data

LIDAR – The Success Story

Airborne LIDAR

**automatic filtering
manual verification**

Terrestrial LIDAR

**sophisticated software like
MENSI RealWorks Survey**

**3D CAD software like AutoCAD
or MicroStation**

Summary

- LIDAR systems are established as surveying tools like GPS or Photogrammetry
- Last 10 years have shown a growing market for these applications
- LIDAR is not only a competition to existing surveying methods, it is a real supplementation with many new applications

Summary

- The terrestrial LIDAR systems will have the same success as the airborne systems
- We are at the challenging beginning of a new generation of surveying devices

Thank You For Your Attention
