

Planning Practicum-Based on Sustainable Development

Haocong Wang (China, PR)

Key words: Spatial planning

SUMMARY

The paper is going to talk about sustainable development and some cases study which based on sustainable theory. There are four case studies in my paper. The first is Japan transportation system, which based on my observation during my summer vacation in Japan. My paper is going to talk about the transportation system; how the commercial area connects the transportation system; the transportation hubs, etc. My second case is China transportation system. I would like to do the comparison of Chinese style and Japanese style and I will list what we should learn from Japanese style. The core of two cases is comparison of Chinese style and Japanese style's relation of transportation hubs and commercial areas. My third and fourth case will be MPC (master planned community) of America. Both of my case are in Texas, third one is woodlands community in Houston; fourth one is River Walk community in San Antonio. At the beginning, I plan to explain the MPC at conceptual level, because I believe it is a new concept for China. Then, I would like to use numbers of charts to specifically describe two different MPC patterns. I will also write the advantages and disadvantages of two different way of developing MPC.
