

Session: Geospatial impact of COVID-19,
Chair: Prof. Markus Schaffert

Importance and Challenges of Location Intelligence in Corona Pandemic

Jaana Mäkelä and Tapio Siltala

BACKGROUND

- WHO announced on the 11th of March 2020 that COVID-19 can be characterized as a pandemic.
 - > resulted in massive migration to remote working
 - > restrictions on movement -> stores and restaurants had to adapt rapidly to new ways of making sales
 - > authorities ja citizens needed up-to-date, reliable and easily understandable information
- Location intelligence has played a crucial role during the pandemic

Koronavilkku

Koronavilkku on Terveyden ja hyvinvoinnin laitoksen tuottama sovellus, jonka avulla saat tiedon, jos olet sovelluksen arvion mukaan altistunut koronavirukselle. Jos sinulla todetaan tartunta, voit ilmoittaa siitä sovelluksella nimettömästi. Sovelluksessa yksityisyytesi on vahvasti suojattu.

[Lue lisää sovelluksesta](#)

Rapid development of location enabled food and meal delivery platforms and services to connect restaurants and grocery stores with customers and couriers

Digital information about customers' behaviors and movements to analyze changes

- **Mobile operator Telia's Crowd Insights (mobile customers' anonymized and aggregated location data)**

High quality location information, efficient data flows and location analytics for route optimization and asset management have been critical

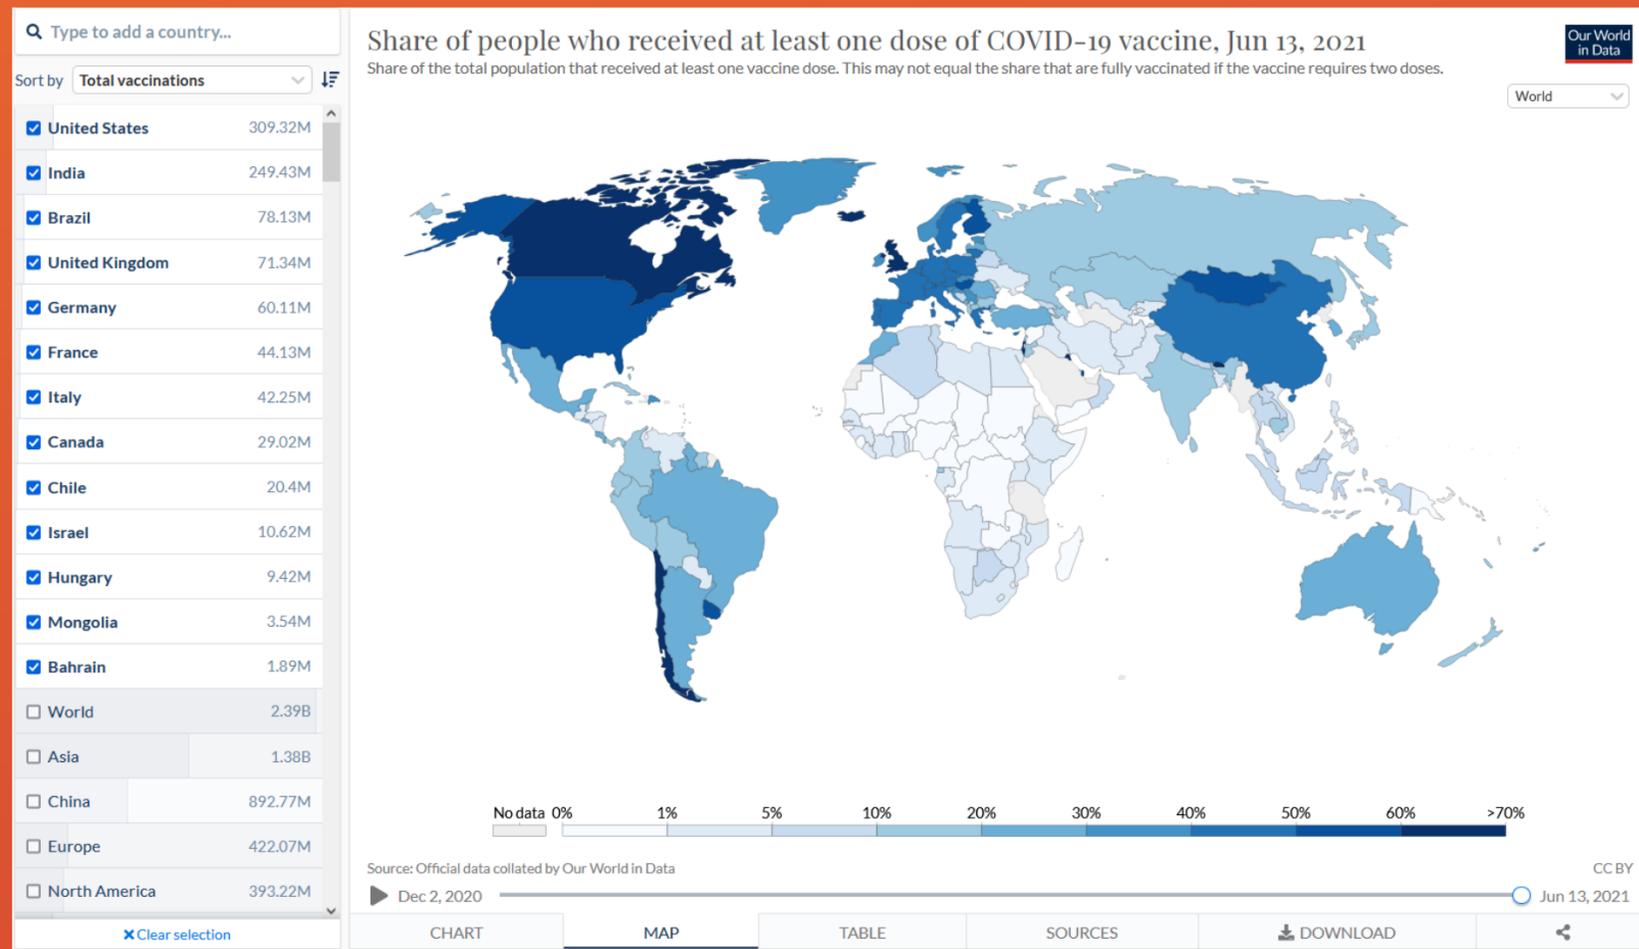

Rapid changes to meal and food delivery

GeoForum Finland
setup a national
Corona GIS group in
March 2020

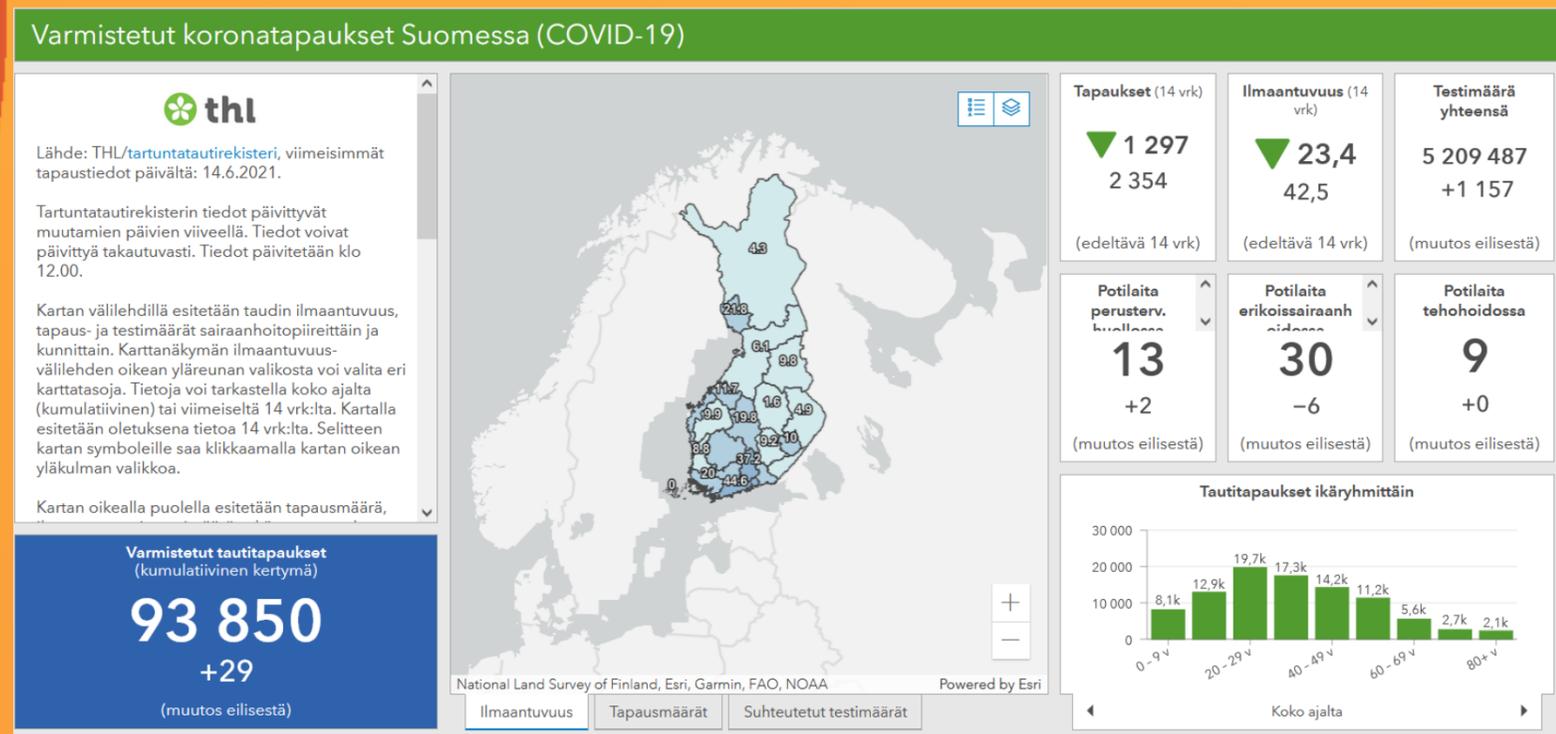

The biggest cities in Finland connected their
location platform's wide capabilities to other
processes and essential data to support the top
management in fast decision making

GIS professionals started new ways to collaborate

CovidJSON (Infection testin

NOTE: this version may change, please contribute using issues or pull requests

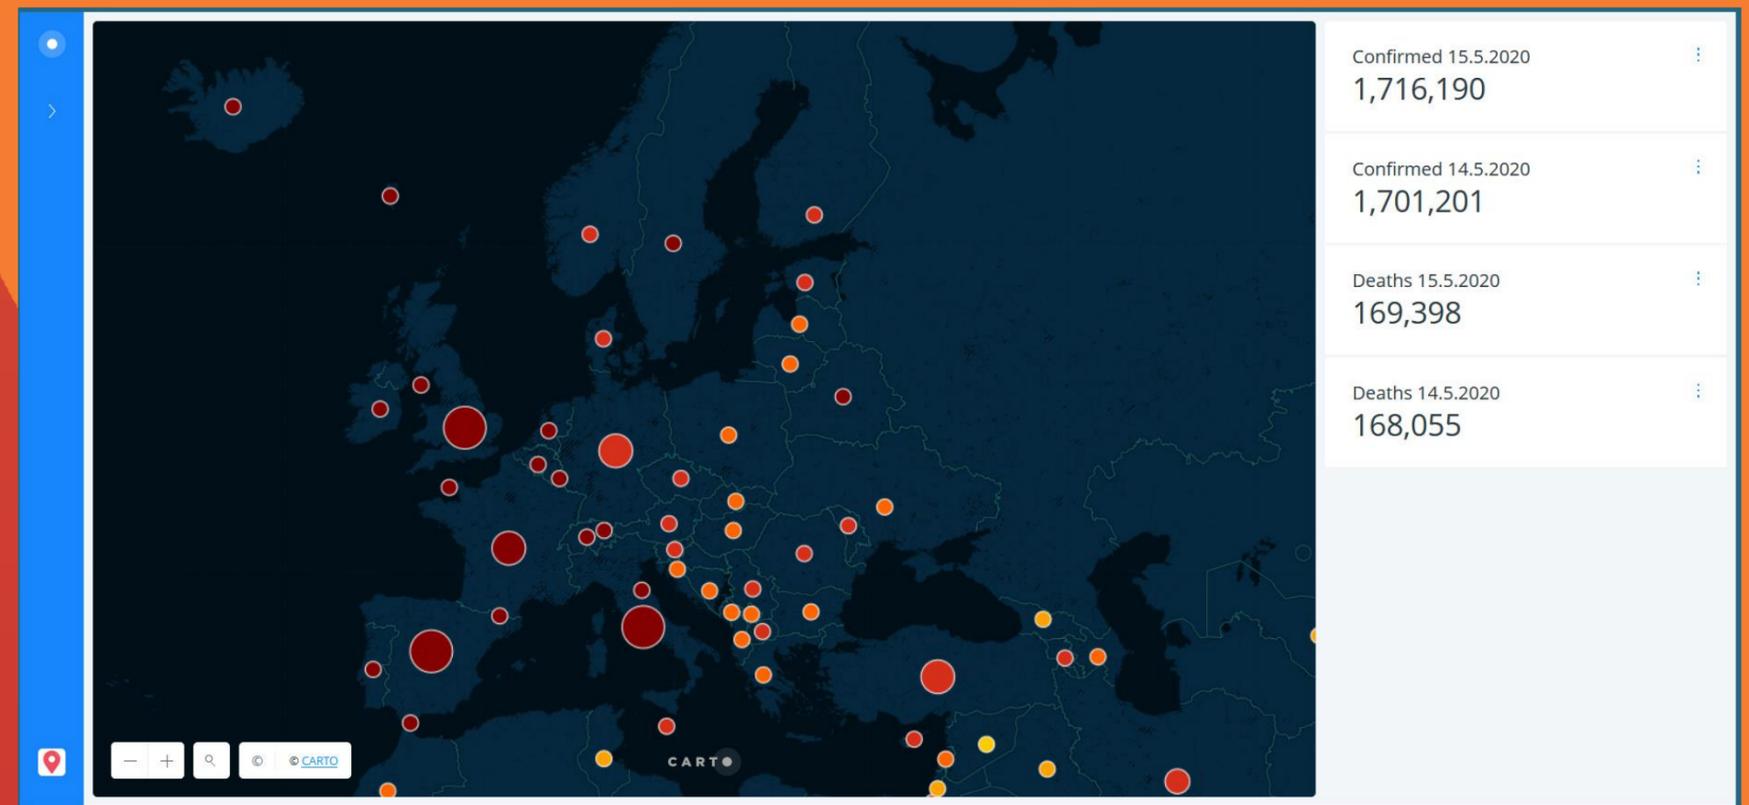

The power of standards

- Spatineo's contribution to the Corona GIS group Finland: **CovidJSON, data model for infection data** (*based on GeoJSON standard*) <https://covidjson.org/> and <https://data.covidjson.org/>
- Data models for two primary epidemic related use cases: **Individual test cases** and **Regional infection statistics.**

Tapio's proof-of-concept

- Established Covid-19 worldwide situation map without coding
 - CARTO's location platform in the cloud
 - Daily download of Covid-19 content from Johns Hopkins site
 - Other data: demographics, acreages, country flags etc.
 - Would have liked to use data APIs especially OGC's Observation and measurements standard for JSON encoding but final releases will be published by the end of 2021

- Data quality and quality checks are needed
- Metadata would have helped a lot
